/site 2: Sfil (ggccgcctcggc); Double-stranded CDNA was prepared from a pool of 40 cell line polya+ RNAs (bladder 2%, blood - 33.4%, brain - 5.6%, breast - 12.5%, colon - 4%, connective tissue - 1.4%, eye - 1%, intestine - 2.6%, kidney - 2.2%, liver - 5.7%, lung - 10.8%, NK-cell - 5.2%, ovary - 4%, pharynx - 2.5%, prostate - 4.3%, salivary gland - 1.3%, and skin - 2.3%); 5' and 3' adaptors were used in cloning as follows:
// ATTCTAGAGGCCGAGAGTGGCCATTAGGGCCGAGTTGGT(30)NN-3'. Full-length enrished library was constructed using the Clontech creator SWART kit and size-selected to contain the 0.5-1 kb size fraction (other fractions present in NIH MGC 127 and NIH MGC 128). Library created in the laboratory of T. library."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             211 TATGTAACACCAGGGGACTCAGAAACAGCACCCGTAGTTACTGTGACCCACAGAAATTAT 270

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ŝ
requests: clonerequest@sanger.ac.uk
On Sep 10, 2001 this sequence version replaced gi:15021284.
During sequence assembly data is compared from overlapping clones.
Where differences are found these are annotated as variations
together with a note of the overlapping clone name. Note that the
variation annotation may not be found in the sequence submission
corresponding to the overlapping clone, as we submit sequences with
only a small overlap as described above.
This sequence was finished as follows unless otherwise noted: all
regions were either double-stranded or sequenced with an alternate
chemistry or covered by high quality data (1.e., phred quality >=
30); an attempt was made to resolve all sequencing problems, such
as compressions and repeats; all regions were covered by at least
one plasmid subclone or more than one Mi3 subclone; and the
assembly was confirmed by restriction digest. The following
abbreviations are used to associate primary accession numbers given
in the feature table with thair source databases: Em: EMBL: Sw:,
SWISSPROT; Tr:, TREMBL; Wp:, WORNFEP; Information on the WORNFEP
database can be found at
http://www.sanger.ac.uk/Projects/C elegans/wormpep This sequence
was generated from part of bacterial clone contigs of human
chromesome 1. constructed by the Sanger Centre Chromosome 1 Mapping
Group. Further information can be found at
http://www.sanger.ac.uk/PGP/Chr1
RPII-SSG1 is from the library RPCI-11.2 constructed by the group
of Pieter de Jong. For further details see
http://www.chori.org/bacpac/home.htm

On Aug 25, 2000 this sequence version replaced gi:9231058.
                                                                                                                                                                                                                                                                                                                                        Assembly program: XGAP4; version 4.5
Sequencing vector: plasmid; 108752; 100% of reads
Chemistry: Dye-terminator Big Dye; 57% of reads
Chemistry: Dye-terminator BT-amersham; 42% of reads
quality: 170939 bases at least Q40
Consensus quality: 172842 bases at least Q30
Consensus quality: 173860 bases at least Q20
Insert size: 175698; sum-of-contigs
Insert size: 182579; 24.9% error; agarose-fp
Quality coverage: 5.06x in Q20 bases; sum-of-contigs Quality
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            NOTE: This is a 'working draft' sequence. It currently consists of 11 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     130404 130503: contig of 2434 bp in length

This clone is available from RZPD;
Contact RZPD (customer.service@rzpd.de) for further information. This CDS clone is part of a collection of human full ORF clones jointly established and verified by the Harvard Institute of Proteomics (HIP) and RZPD.

This CDS has been cloned without stopcodon.

The CDS has been inserted into pDONRZO1 via a BP Clonase(TM) reaction. Additional sequence has been added in front of the start codon: att. AAAAAA GCA GGC TCC ACC (ATG).

The last codon is followed by the 3' att site: GACCCAGCTTTCTT. att The clone is validated by till sequence check.

Compared to the reference sequence NM_003874 (GI:4502666) we found AA exchange(s) at position (first base of changed triplet):

880(pro-ser)

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

This sequence represents a nucleic acid molecule designated Gene 164 from the human cDNA clone HSAWF26 (deposited as clone ATCC 97903 and ATCC 979049) which encodes a secreted human protein. The gene can be used to generate fusion proteins by linking to the gene to a human immunoglobulin Fc portion (e.g. AAV59502) for increasing the stability of the fused protein as compared to the human protein only. The invention relates to 186 novel genes and their fragments (nucleic acid sequences: AAV5951-V59812; amino acid sequences AAW74731-W75026) which are useful for preventing, treating or ameliorating medical conditions can be diagnosed by determining the presence of mutations in the new polynocleotides by determining the presence of mutations in the new polynucleotides, based on which tissues are described for each of the 186 polynucleotides, based on which tissues they are most highly expressed in (see AAV59511 for
                                                                                                                                                                                                                       Ruben SM, Rosen CA, Fischer CL, Soppet DR, Carter KC;

Greene JM

The invention relates to an isolated protein that is one of 186 human secreted proteins, given in the specification, encoded by one of 309 CDNA sequences also given in the specification, encoded by one of 309 CDNA sequences also given in the specification. The protein is used in a condition in e.g. humans, mice, rabbits, goats, horses, cats, dogs, chickens or sheep. Disorders which are diagnosed or treated include autoimmune diseases e.g. rheumatoid arthritis, hyperproliferation conditions in nervous system disorders e.g. cerebral ischaemia, cargiogenesis, nervous system disorders e.g. Alzheimer's disease, infections caused by bacteria, viruses and fungi and ocular disorders conspitualin cell proliferation, to prevent skin aging due to subburn, to maintain organs before transplantation, for supporting cell culture of primary tissues, to regenerate tissues and in chemotaxis. The culture of primary tissues, to regenerate tissues and in chemotaxis. The culture of primary tissues, to regenerate tissues and in chemotaxis. The culture of primary tissues, to regenerate tissues and in chemotaxis. The culture of the preserve the servertive to increase or decrease storage capabilities, fat content, lipid, protein, carbohydrate, vitamins, minerals, cofactors and other nutritional components. The present sequence represents a cDNA derived from a gene encoding one of the novel human secreted proteins of the invention. Note: This sequence did not form part of the printed specification, but was contained in electronic format directly from USPTO at
